INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from LDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.

This final report on research conducted at Northwestern University under Contract Number N00014-67-A-0356-0023 covers the period from 1 April, 1971 through 31 March, 1972. The work conducted under this contract was in the areas of thin-film devices and computer graphics.

The results achieved are summarized on the following pages.

Thin-Film Field-Effect Transistor, Professor M. Epstein, F. C. Luo

The objective of this program was to prepare very thin films of InSb to be used in phonon amplifiers for acoustic surface waves on LiNbO_3 and PZT substrates. High mobility films ($20,000 \text{ cm}^2/\text{Volt-sec.}$, 1 micron thick) were obtained by flush evaporation and recrystallization in very pure inert atmosphere. Also, very thin specimens of n-type InSb ($300\text{-}400\text{\AA}$) were obtained with relatively high Hall mobilities ($300 \text{ cm}^2/\text{Volt-sec}$) and majority carrier concentration of $5 \times 10^{17}/\text{cm}^3$. By employing the above films in a coplanar structure of a FET with indium source and drain electrodes, a 350\AA SiO_2 insulator, and aluminum gate electrode, successful transistor action, including pinch-off, was obtained. The transconductance of the TFT was about $6000 \text{ }\mu\text{mhos}$, the highest value ever reported. It was found that the InSb thin-film FET has high strain sensitivity ($\approx 6,000$ volts per unit strain) and its application to the detection of surface acoustic waves is now being considered.

A paper, entitled "Coplanar Thin-Film InSb Transistor", by F. C. Luo and M. Epstein, has been submitted to the IEEE Proceedings. Another paper by the same authors is in preparation.

A patent disclosure, entitled "Stabilization and Control of Acoustic Surface-Wave Devices", has been submitted by M. Epstein.

Raster-Type Display with Interactive Graphics Capability, Professor B. W. Jordan, R. C. Barrett, S. Thieler, J. E. Allen, R. P. Cember, R. Langley

The possibility of designing a microprogram controlled character generator capable of refreshing the cell display in real time was investigated. The required functions were isolated, and the necessary primitive instructions were developed. Tradeoffs between vertical and horizontal microprogramming were investigated. Control store organization and requirements were defined. The execution facilities were described and performance was studied. A microprogram controlled character generator was shown to be feasible for real-time refresh of the cell display.

A design for the Display Output Buffer for the cell display was developed. The ability to repeat single characters as well as strings of characters was included in the design. A format for storing information pertaining to the repeat feature was developed, along with algorithms for its implementation, and the hardware design for the Display Output Buffer was completed and the buffer was constructed.

A capacitive read-only memory, of 1408 80-bit words with a cycle time of 80 nanoseconds, for use in the microprogram controlled character generator was designed, and a prototype of 12 8-bit words was constructed.

The Display Output Buffer was simulated in Fortran to verify its operation and determine its influence on the performance of the system. This led to several modifications in the design of the Display Output Buffer.

The number of primitives required to reproduce any figure drawn from straight lines in cell display with an arbitrary number of points and an arbitrary cell size was determined. It was found that 108 graphical primitives are required for a 512 by 512 display using 8 by 8 cells.

The instructions required to generate arbitrary figures on a cell display using the graphical primitives determined earlier and the available functional manipulations were determined. This instruction set is being used in the cell display simulation now under development.

Algorithms for the translation of picture information from xy format to the cell display format have been developed. A paper by B. W. Jordan and R. C. Barrett, entitled "A Scan Conversion Algorithm with Reduced Storage Requirements",* on the translation from xy format to raster format has been submitted for publication.

A simulation of the entire cell display is now in progress. Many pictures of varying complexity are to be run through it to determine the choice of several important parameters as well as the limits of performance.

*A preliminary form of this paper entitled "A Display File Compiler for Raster Plotters", has been sent to ONR.
